

## 8.10.20 Axis Release Notes

### Enhancements

- **Event Specific Notifications now populate with the Site Default Notification when created with the new email editor**

Use Case: If a site default event notification has been created with the new email editor, it will now populate as the template for event specific notifications when edited with the new email editor. This means the event specific notification no longer has to be created from scratch when a new editor site default already exists.

- **“Save as New Schedule” now works for court-based Pool Reservation systems**

Use Case: The “Save as New Schedule” feature was added in a recent release for some reservation systems, such as Dining and Tee Times. This allow you to quickly and easily clone an existing schedule. This functionality is now available in courts-based Pool Reservation systems.

### Other Features/Bug Fixes

- Fixed an issue that prevented the use of the New Email Editor when creating certain types of emails in the CRM.
- Fixed an issue that caused a webpage error when attempting to edit a sub-navigation or side-navigation menu within a page.
- Fixed an issue that prevented the population of statement snippets for Paycloud users in certain circumstances.
- Fixed an issue that prevented a member from receiving an email if the primary email address on their account was also present as the secondary email address on an inactive or expired account.
- Fixed an issue that prevented the adding of new guests via mobile in Pool Reservations.
- Fixed an issue that caused a webpage error for administrators accessing the Guest Manager if Guests missing certain information were present.

- Fixed an issue that resulted in a webpage error when navigating events via the “Previous” and “Next” buttons under certain circumstances.
- Fixed an issue with hyperlink filtering that was allowing non-whitelisted URLs with certain formatting.
